Assignment 03 Out: 11/06 19:00 Due: 11/20 19:00

Instructions Collaboration:

Collaboration on solving the assignment is allowed, after you have thought about the problem sets on your own. It is also OK to get clarification (but not solutions) from online resources, again after you have thought about the problem sets on your own.

There are two requirements for collaboration:

Cite your collaborators fully and completely (e.g., "XXX explained to me what is asked in problem set 3"). Or cite online resources (e.g., "I got inspired by reading XXX") that helped you.

Write your scripts and report independently - the scripts and report must come from you only.

Submitting your assignment:

Please write a report PS3.pdf.

Create a jupyter notebook named PS3.ipynb.

Upload your jupyter notebook and report to your Github ESE5023\_Assignments\_XXX repository (where XXX is your SUSTech ID) before the due time.

Late Submission:

Late submissions will not receive any credit. The submission time will be determined based on your latest GitHub file records.

1. Global methane levels from 2002 Methane (CH4) is a naturally occurring Greenhouse Gas (GHG), but one whose abundance has been increased substantially above its pre-industrial value by human activities, primarily because of agricultural emissions (e.g., rice production, ruminants) and fossil fuel production and use. A clear annual cycle is largely due to seasonal wetland emissions.

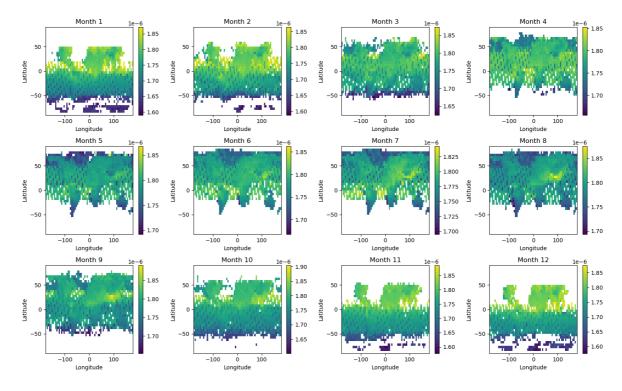

Atmospheric methane abundance is indirectly observed by various satellite instruments. These instruments measure spectrally resolved near-infrared and infrared radiation reflected or emitted by the Earth and its atmosphere. In the measured signal, molecular absorption signatures from methane and constituent gasses can be identified. It is through analysis of those absorption lines in these radiance observations that the averaged methane abundance in the sampled atmospheric column can be determined.

For this problem set, methane levels have been determined by applying several algorithms to different satellite instruments. Download the netCDF4 file (200301\_202006-C3S-L3\_GHG-PRODUCTS-OBS4MIPS-MERGED-v4.3.nc) here, which contains monthly-averaged methane levels (xch4) in the unit of ppb at each 5° (lon) x 5° (lat) grid over the globe from 2003-01 to 2020-06.

**1.1** [5 points] Compute methane climatology for each month, and plot your results in 12 panels.

```
In [1]: import numpy
        import pandas as pd
        import netCDF4
        import xarray as xr
        from matplotlib import pyplot as plt
        %matplotlib inline
        # 读取NetCDF文件
        file_path = r"D:\ese5023\200301_202006-C3S-L3_GHG-PRODUCTS-OBS4MIPS-MERGED-v4.3.
        data = xr.open_dataset(file_path)
        #提取xch4的数据
        xch4 = data['xch4']
        print(xch4)
        # 按月份分组并计算月气候学平均
        monthly_climatology = xch4.groupby("time.month").mean(dim="time")
        # 设置绘图
        fig, axes = plt.subplots(3, 4, figsize=(15, 10))
        fig.suptitle('Monthly Climatology of Methane (XCH4)', fontsize=16)
        # 循环绘制每个月的气候学平均
        for i, month in enumerate(range(1, 13)):
           ax = axes[i // 4, i % 4]
           climatology = monthly_climatology.sel(month=month)
           # 绘制月气候平均数据
           pcm = ax.pcolormesh(climatology['lon'], climatology['lat'], climatology,
                               cmap='viridis', shading='auto')
           ax.set title(f"Month {month}")
           ax.set_xlabel("Longitude")
           ax.set_ylabel("Latitude")
           #添加颜色条
           fig.colorbar(pcm, ax=ax, orientation='vertical')
        # 调整布局
        plt.tight_layout(rect=[0, 0, 1, 0.95])
        plt.show()

```

**1.2** [5 points] Plot globally-averaged methane from 2003-01 to 2020-06 as a time series. Describe your results. Check your plot with this one.

```
In [3]: # 计算全球平均甲烷浓度(在 Lat 和 Lon 维度上取平均)
global_mean_xch4 = xch4.mean(dim=["lat", "lon"])

# 绘制时间序列
plt.figure(figsize=(12, 6))
plt.plot(global_mean_xch4["time"], global_mean_xch4, label="Global Average Metha plt.xlabel("Time")
plt.ylabel("Methane Concentration (XCH4)")
plt.title("Globally Averaged Methane Concentration (2003-01 to 2020-06)")
plt.legend()
plt.grid(True)
plt.show()
```

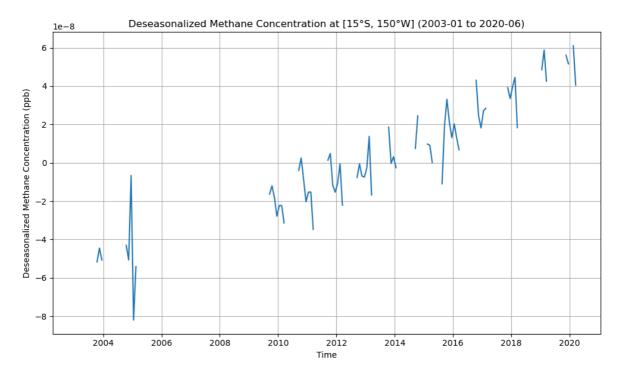

解释结果随时间成螺旋上升状态,说明空气中的气体含量逐渐增加。

Plot deseasonalized methane levels at point [15°S, 150°W] from 2003-01 to 2020-06 as a time series. Describe your results

\*1.3\* [5 points] Plot deseasonalized methane levels at point [15°S, 150°W] from 2003-01 to 2020-06 as a time series. Describe your results.

```
In [51]: # Question 3
         # Select the point [15°S, 150°W], which corresponds to lat=-15, lon=-150
         level_15_150 = data.sel(lat=-15, lon=-150, method='nearest')
         # Compute the seasonal cycle: average methane concentration for each month
         seasonal_cycle = level_15_150.groupby('time.month').mean(dim='time')
         # Compute the deseasonalized methane levels by subtracting the seasonal cycle fr
         deseasonalized_methane = level_15_150 - seasonal_cycle.sel(month=level_15_150.ti
         # Plot the deseasonalized methane time series
         plt.figure(figsize=(10, 6))
         plt.plot(deseasonalized methane['time'],deseasonalized methane['xch4'], label='D
         plt.title('Deseasonalized Methane Concentration at [15°S, 150°W] (2003-01 to 202
         plt.xlabel('Time')
         plt.ylabel('Deseasonalized Methane Concentration (ppb)')
         plt.grid(True)
         plt.tight layout()
         plt.show()
```

解释从04年到2020年,异常值越来越高,说明甲烷含量明显增加。

**2**. Niño 3.4 index The Niño 3.4 anomalies may be thought of as representing the average equatorial sea surface temperatures (SSTs) across the Pacific from about the dateline to the South American coast (5N-5S, 170W-120W). The Niño 3.4 index typically uses a 3-month running mean, and El Niño or La Niña events are defined when the Niño 3.4 SSTs exceed +/- 0.5°C for a period of 5 months or more. Check Equatorial Pacific Sea Surface Temperatures for more about the Niño 3.4 index.

In this problem set, you will use the sea surface temperature (SST) data from NOAA. Download the netCDF4 file (NOAA NCDC ERSST v3b SST.nc) here.

\*2.1\* [10 points] Compute monthly climatology for SST from Niño 3.4 region, and subtract climatology from SST time series to obtain anomalies.

```
In [59]: import xarray as xr import numpy as np import pandas as pd

# 1. 读取数据文件(假设文件名为 'NOAA_NCDC_ERSST_v3b_SST.nc') file_path = 'NOAA_NCDC_ERSST_v3b_SST.nc' # 替换为实际数据文件路径 ds = xr.open_dataset(file_path)

# 2. 提取 Niño 3.4 区域数据 (5°N-5°S, 170°W-120°W) lat_bounds = (-5, 5) # 纬度范围 lon_bounds = (190, 240) # 经度范围 (170°W = 190, 120°W = 240)

# 选择感兴趣的区域 nino34_region = ds['sst'].sel( lat=slice(lat_bounds[0], lat_bounds[1]), lon=slice(lon_bounds[0], lon_bounds[1]))

# 3. 计算每月的气候学平均值(长期月平均值)
```

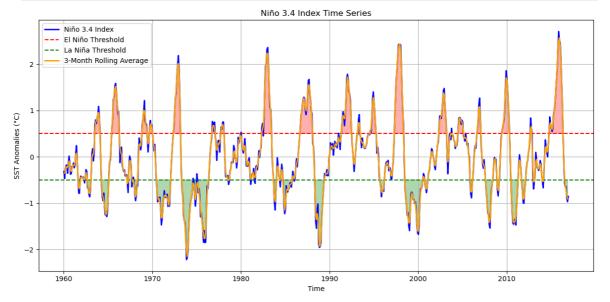

```
monthly_climatology = nino34_region.groupby('time.month').mean(dim='time')
 # 4. 计算 SST 异常值(原始数据减去气候学平均值)
 sst_anomalies = nino34_region.groupby('time.month') - monthly_climatology
 # 5. 查看计算的异常值
 print(sst_anomalies)
<xarray.DataArray 'sst' (time: 684, lat: 5, lon: 26)>
